

Final Executive Summary

Strategic Customer Experience Analysis

Objective: To provide executive insights and data-driven recommendations, derived from a comprehensive analysis of passenger satisfaction, service execution, and demographic performance.

Analytical Focus	Updated Key Finding	Strategic Recommendation
1. Net Satisfaction Score (Overall Health)	Business Travel is the only segment registering a strong net positive satisfaction score. All other segments, particularly Personal Travel, register a significant net negative score.	Shift focus from general "satisfaction improvement" to "converting negative satisfaction to positive" in the Personal Travel segment through targeted, high-impact service interventions.
2. Service Performance (Micro-Level)	Weakest Link: Service friction is highest in digital and coordination areas such as Ease of Online Booking and Departure/Arrival time convenient. Human-interaction services generally score higher.	Implement an urgent cross-functional team to diagnose digital and schedule friction in the pre-flight phase, as this frustration often preempts the entire passenger experience.
3. Class & Value Perception	Value Disconnect: The premium Eco Plus class significantly underperforms the standard Eco class, indicating a failure in the value proposition for the premium paid.	Conduct an immediate service audit and value revamp for Eco Plus to ensure that the service level justifies the premium pricing point.

Analytical Focus	Updated Key Finding	Strategic Recommendation
4. Delay Impact (Root Cause)	Delays exceeding 45 minutes act as a major neutralizer of satisfaction, overriding any positive service experience provided beforehand.	Mandate a proactive delay communication protocol that triggers automatically at the 30-minute mark, including real-time updates and proactive service recovery (e.g., compensation codes or vouchers).
5. Demographics (Age & Gender)	Disloyal Female passengers record the lowest satisfaction scores across all segments. Furthermore, specific age groups (often very young and very old) show unusual dips in satisfaction.	Design training modules and operational focus areas aimed at empathetic service delivery for vulnerable or less frequent travelers (e.g., specific age groups or female disloyal travelers) to mitigate high-risk churn.

Overall Conclusion: Elevating the passenger experience requires immediate, surgical action focused on areas registering negative net satisfaction (Personal Travel, Eco Plus). The primary strategic priority is investing in smooth digital coordination and mitigating high-impact delays, which provide the greatest potential for long-term loyalty growth.
